The global equity markets made strong gains in November, buoyed up by Donald Trump's reelection in the USA and the Red Sweep. The priorities announced by the new administration include lowering taxes, raising tariffs and placing tighter restrictions on immigration. In Europe, there is little room for optimism given the strained trade relations that exist between the USA and China, the political crisis in France, and the signs that the economy is slowing down. In China, the stimulus plan introduced in October is so far showing few signs of paying off and further announcements are expected.

Our US exposures were among the top contributors to the portfolio's performance whereas our European stocks held it back. Positive contributions came from Quanta Services, Republic Services and Trane Technologies. At the other end of the spectrum, our positions in ERG, Kingspan and Veolia were among the poorest contributors. Given the circumstances, we shored up our positions in stocks like Eaton which is exposed to reshoring and electrification in the USA. We scaled back our exposure to European renewable energy firms by exiting from ERG and we removed Legrand from our portfolio due to political uncertainty in France.

Donald Trump's re-election could affect responsible investment and the climate. On the other hand, America's manufacturing industries are likely to benefit from deregulation, lower taxes and Trump's tariffs policy. But the priority given to reshoring and to strategic industries like semiconductors and electrical equipment will create opportunities as these sectors could benefit from the new political landscape.

👣 UNDERSTANDING THE CLIMATE CHALLENGE

Definitions & acronyms

DESCRIPTION OF INDICATORS

Green Share

The green share of the portfolio corresponds to the percentage of revenues of companies eligible for the European taxonomy. This green taxonomy establishes criteria to orient finance in favour of climate-compatible activities. Three types of activities and six major environment objectives are identified:

Three types of activities identified Low carbon activities **Activities making** Transition activities already compatible with a possible carbon contributing to a carbon carbon neutral economy neutrality with steep neutral economy in 2050 in 2050

Six major environmental objectives			
Climate change mitigation	Adaptation to climate change		
Sustainable use / protection of water and marine resources	Fight against pollution (prevention & control)		
Transition to a circular economy, elimination of waste, recycling	Protection of healthy ecosystems		
	*GHG: groophouse gas		

An activity is defined as green when it makes a substantial contribution to one of the six objectives without significantly impairing another objective and when it is in conformity with minimal social guarantees and the selection criteria.

Greenfin typology

Created by the French ecological and solidarity transition ministry, the Greenfin label guarantees the green quality of investment funds and is meant for financial players that work to promote the common good through transparent and sustainable practices. This label defines eco-activities that are part of the energy transition. These activities produce goods and services involving environmental protection or natural resource management that are designed to measure, prevent, limit or correct environmental damages to water, the air and soil and problems relating to waste, noise and ecosystems in favour of human wellbeing (OECD and Eurostat international definition). For each issuer, the eligible revenues are analysed on the "precision" level of the Greenfin label standards (annex 1 of the standards).

ENERGY	BUILDING CONSTRUCTION	CLEAN TRANSPORTATION	INFORMATION AND COMMUNICATIONS TECHNOLOGIES
WASTE MANAGEMENT AND POLLUTION CONTROL	INDUSTRY	AGRICULTURE AND FORESTS	ADAPTATION TO CLIMATE CHANGE

Exclusion: all fossil (exploration, production, exploitation) and nuclear (extraction of uranium, concentration, refining, radioactive waste conversion and enrichment management, decommissioning) fuels. Partial exclusion (>33% of revenues): storage and landfill without GHG capture, incineration without energy recovery, logging (except for sustainable operations).

Carbon footprint

The carbon emissions indicator represents the direct emissions (scope 1) and the "First Tier Indirect" emissions (scope 2 + emissions relating to leading suppliers) of companies held in the portfolio. The unit of measurement used to measure the carbon footprint is metric ton of CO2 per million of euros invested (tCO2e/€m).

Alignment scenario and temperature

The Science Based Targets (SBT) initiative enables companies to define and submit their greenhouse gas reduction objectives (scopes 1 and 2 + Scope 3 if this represents more than 40% of emissions) in order to respect the Paris Agreement on Climate Change (signed in 2015), whose objective is to limit global warming to under 2°C compared to the pre-industrial era and to pursue efforts to limit warming to 1.5°C. Over 900 companies throughout the world have already submitted their scenarios to the SBT. The list can be consulted on the https://sciencebasedtargets.org/companies-takingaction website.

Biodiversity / Mandarine Biodiversity Score

The Mandarine Biodiversity Score, created in-house by Mandarine, enables the evaluation of the biodiversity score and risk of companies based on three elements: company disclosures (biodiversity strategy, management of natural resources and waste, climate scenario), the pressure it exerts on ecosystems (CO2 and pollution emissions, consumption of natural resources) and finally, the double materiality (impact / dependence of the company on biodiversity).

Alignment with the taxonomy

The data regarding the alignment of revenues with the taxonomy are supplied by Sustainalytics. The share of revenues allocated to the taxonomy is calculated through a four-step process: 1/ identification of activities eligible for the taxonomy, 2/ respect of the activity with the technical criteria of the taxonomy, 3/ respect of the DSNH (Do no Significant Harm) principle, i.e. no prejudicial impact on the other environmental objectives of the taxonomy, and 4/ guarantee of minimum social standards. The figures are derived from annual reports or estimates provided by the supplier of ESG data.

GLOSSARY

GHG / Greenhouse gas

The GHGs are gaseous components of the atmosphere, both natural and anthropogenic, that absorb and re-emit infrared radiation. These gases are responsible for the warming of the atmosphere. By way of example, the lifetime of greenhouse gases in the atmosphere is approximately 100 years for carbon dioxide (CO2), 120 years for nitrous oxide and up to 50,000 years for the halocarbons (source: ADEME).

SBT / Science-Based Targets

SBT is a set of methodologies with a shared principle of identifying the remaining carbon budget in order to avoid exceeding 1.5°C in global warming looking out to 2100 and allocates this carbon budget to different sectors of activities. This initiative was launched by the WWF (World Wildlife Fund), WRI (World Resources Institute) and CDP (Carbon Disclosure Project), with the latter now integrating the SBT concept in its ratings.

SDG / Sustainable Development Goals

The sustainable development goals are a call to action by all countries in order to promote prosperity while protecting the planet. They go hand in hand with strategies for the development of economic growth and respond to a series of social needs while at the same time protecting the environment and fighting against climate change.
